

The discussion is about the latest episode of Tech Talk, an audio podcast on the website EnglishWaves.fr. It focused on the legal issues between Apple and the FBI, particularly the difficulty governments face in accessing end-to-end encrypted data, which is a technology becoming more widespread. With the end-to-end encryption technology introduced by WhatsApp, the company claims that no one will be able to access the content, whether it's an image, text, or any other data. For users, nothing will change, but it will be harder for authorities to get information. According to WhatsApp, the app is becoming the most secure way to communicate online. With such encryption, it might be possible to reveal information about the Panama Papers in China, where all websites have been ordered to delete the information.

A new vulnerability was detected on the iPhone 6S and 6S Plus, which could allow access to photos and contacts. However, Apple has already released a fix. In the audio extract, cybersecurity is presented as a major issue in the coming years. Additionally, elderly people are becoming more vulnerable to hackers as they are less educated about technology. The presenter tells us that next week, they will talk about passwords and the importance of protecting them.
